

ABSTRACT

A candle composition has a paraffin wax mixture of a high melting point paraffin wax and a low melting point paraffin wax, and a hydrogenated vegetable oil that is present in a greater amount than the mixture of the varying grades of paraffin wax, and the vegetable oil contains no more than 0.15% free fatty acid, with the remainder being triglycerides. Candles of the composition have good burn characteristics, particularly good fragrance intensity and produce a unique crystallization effect after the first burn.
